

ABSTRACT

A golf club comprises a handgrip; a club head, and a club body between the first end and the second end. A cross section area of the club body includes a front portion having a first and a second including
5 surfaces that define a front cusp in front of said first and said second inclined surfaces; a rear portion having a third and a fourth inclined surface that define a rear cusp at a rear connecting end of the third and fourth surfaces; and a middle section being curved inwards. In a
10 direction from the handgrip to the club head, the club body has at least one reduced segment having a smaller size than other portion thereof, and a shoulder is formed between each reduced segment and an adjacent other portion of the golf club.
